SGPIO Interface

Full Spec-Compliant HDL Design Report

Updated Version - SFF-8485 Revision 0.7 Complete Implementation

Specification:	SFF-8485 Revision 0.7 - Serial GPIO Bus
Project No.:	SETU Project #17 | Electronics Domain | Zoho Nagpur
HDL Language:	Verilog
Simulator:	ModelSim - Intel FPGA Edition 2020.1
New in this version:	Blink Gens A+B, Auto-flash 5-state FSM, All Table 25/26/27 modes
GitHub:	github.com/shreyp123/SGPIO-INTERFACE

SUBMITTED BY

April 2026

1. Introduction

This report documents the **updated and fully specification-compliant** implementation of the SGPIO Initiator module in Verilog, based on SFF-8485 Revision 0.7. The previous version only covered the basic protocol layer (frame structure, SCLK generation, tristate rules). This new version implements the complete specification including hardware blink generators, all LED control modes from Tables 25, 26 and 27, the 5-state activity auto-flash state machine with all four timing controls, correct idle vs tristate bus behaviour, and a testbench with 13 test cases covering every mode.

2. What Changed From Previous Version

The table below shows every gap identified in the previous version and confirms what was added in this updated implementation.

Feature	Previous Version	This Version	Spec Ref
Blink Generator A	Not implemented	Full hardware counter, configurable rate	Table 16
Blink Generator B	Not implemented	Independent counter, separate rate	Table 16
Activity modes 000-111	Raw bit passthrough only	All 8 modes implemented (Table 25)	Table 25
Locate modes 00-11	Not implemented	All 4 modes implemented	Table 26
Error modes 000-111	Not implemented	All 8 modes implemented	Table 27
Auto-flash SOF/EOF	Not implemented	5-state FSM per drive	Sec 7.4
Stretch Activity On	Not implemented	T_STRON timer in state 1	Table 20
Max Activity On	Not implemented	T_MAXON timer in state 2	Table 18
Force Activity Off	Not implemented	T_FRCOFF timer in state 3	Table 17
Stretch Activity Off	Not implemented	T_STROFF timer in state 4	Table 19
Bus idle (en=0)	SCLK=1 (wrong)	SCLK=0, SLOAD=0 (correct)	Sec 7.2
Bus tristate (rst_n=0)	SCLK=1 (correct)	SCLK=1 (correct, no change)	Sec 7.2
gpio_tx port	12-bit raw	N*8 bits with packed fields	Sec 8.4.4
SOF/EOF trigger ports	Not present	sof[N-1:0], eof[N-1:0] added	Table 25
64ms reset detection	Not in testbench	Implemented in target sim	Sec 7.1
Test cases	8 basic tests	13 tests covering all modes	All tables

3. SGPIO Bus Signals (SFF-8485 Table 2)

Signal	Direction	Description
SCLK	Initiator -> Target	Serial clock. 32 Hz min to 100 kHz max (Table 5)
SLOAD	Initiator -> Target	Frame marker. HIGH for 1 cycle = end of stream (Sec 7.3)
SDO	Initiator -> Target	Computed LED control bits (blink gens + auto-flash + direct)
SDI	Target -> Initiator	Drive status bits. 0=present, 1=absent (Sec 10.3, Table 43)

4. New Port Interface (Updated Module)

Port	Width	Direction	Description
clk	1	input	System clock (50 MHz for HALF=250)
rst_n	1	input	Async reset active-low. All bus pins tristate when LOW
en	1	input	1=run bus, 0=idle (SCLK=0, SLOAD=0 per spec 7.2)
bga_rate	4	input	Blink gen A half-period rate (Table 16: 0h=1/8s)
bgb_rate	4	input	Blink gen B half-period rate (Table 16)
frc_off	4	input	Force activity off time (Table 17: 1h=1/8s default)
max_on	4	input	Max activity on time (Table 18: 2h=1/2s default)
str_off	4	input	Stretch activity off time (Table 19: 0h=none default)
str_on	4	input	Stretch activity on time (Table 20: 0h=1/64s default)
gpio_tx	N*8	input	LED control: {act[2:0], loc[1:0], err[2:0]} per drive
sof	N	input	Start-of-frame trigger per drive (for activity mode 101b)
eof	N	input	End-of-frame trigger per drive (for activity mode 100b)
gpio_rx	N*3	output	Received drive status bits (GPIO_RX register, Sec 8.4.3)
rx_rdy	1	output	Pulses HIGH 1 cycle when gpio_rx updated
SCLK	1	output	Serial clock to backplane
SLOAD	1	output	Frame marker to backplane
SDO	1	output	Computed LED serial data to backplane
SDI	1	input	Drive status serial data from backplane

5. Design Calculations

5.1 Clock and Frame Timing

Parameter	Formula	Result
System Clock	Given	50 MHz
System Clock Period	1 / 50 MHz	20 ns
SCLK Half Period	HALF x 20 ns	250 x 20 = 5000 ns
SCLK Frequency	1 / (2 x 5000 ns)	100 kHz (spec max Table 5)
SCLK HIGH Time	= Half Period	5000 ns (spec min 4400 ns) PASS
SCLK LOW Time	= Half Period	5000 ns (spec min 4700 ns) PASS
Data bits per frame	N x 3	4 x 3 = 12 bits
Total frame length	12 + 1 + 4	17 SCLK cycles
Frame duration	17 x 10 us	170 us per frame

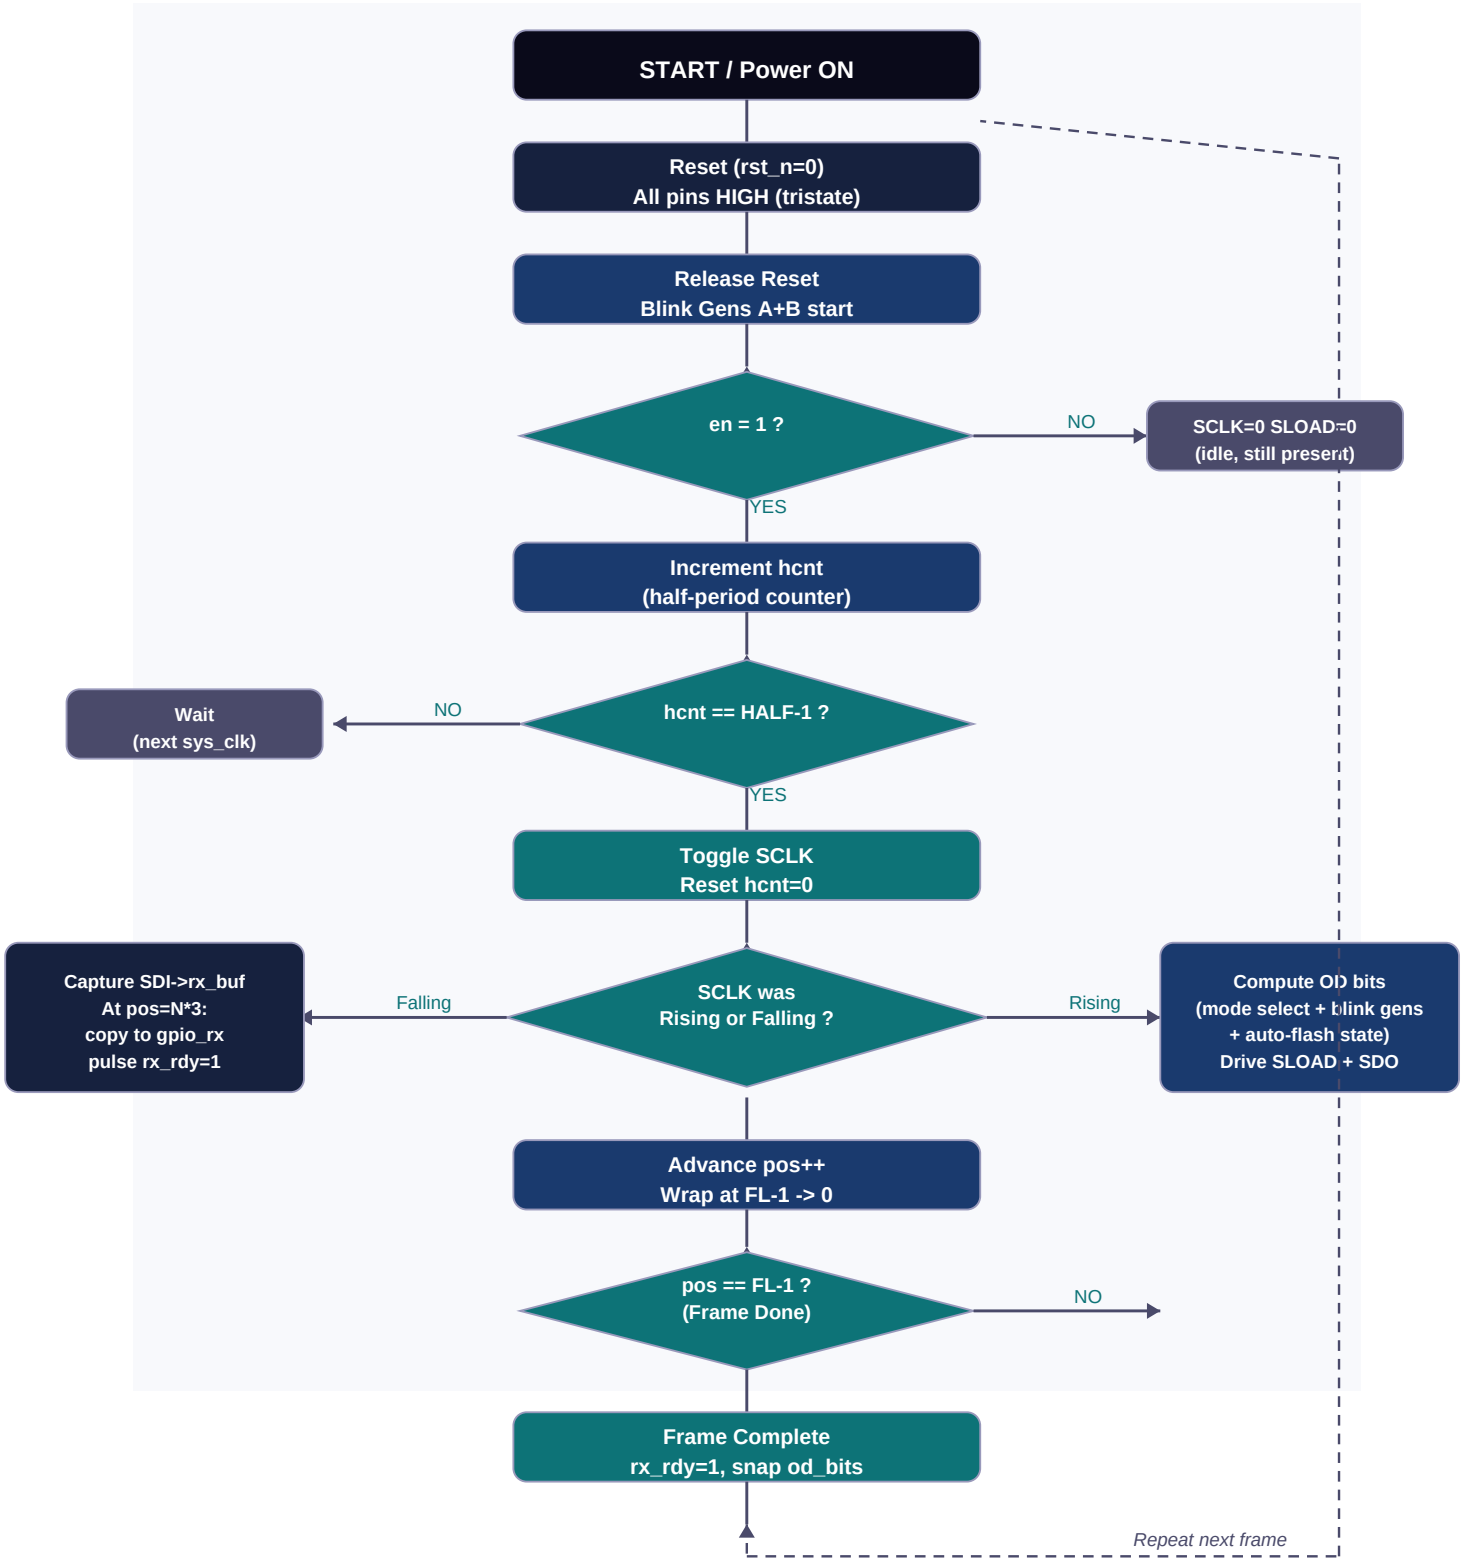
5.2 LED Timing Parameter Calculations (TBASE = 6,250,000)

Parameter	Formula	Default Code	Default Value
T_STRON	(str_on+1) x TBASE/8	0h	(0+1) x 781,250 = 781,250 cycles = 1/64 s
T_STROFF	str_off x TBASE/8	0h	0 x 781,250 = 0 = no minimum
T_MAXON	max_on x TBASE x 2	2h	2 x 12,500,000 = 25,000,000 = 1/2 s
T_FRCOFF	frc_off x TBASE	1h	1 x 6,250,000 = 6,250,000 = 1/8 s
T_BGA	(bga_rate+1) x TBASE	0h	(0+1) x 6,250,000 = 6,250,000 = 1/8 s
T_BGB	(bgb_rate+1) x TBASE	1h	(1+1) x 6,250,000 = 12,500,000 = 1/4 s

5.3 Activity Auto-Flash State Machine

State	Name	LED	Condition to move to next state
0	IDLE	OFF	SOF trigger (mode 101) or EOF trigger (mode 100)
1	STRETCH ON	ON	acnt >= T_STRON (minimum ON time reached)
2	MAX ON	ON	acnt >= T_MAXON (max ON time reached) OR re-trigger resets acnt
3	FORCE OFF	OFF	acnt >= T_FRCOFF (mandatory OFF period done)
4	STRETCH OFF	OFF	acnt >= T_STROFF (minimum OFF time done) -> back to state 0

6. Process Flowchart - Updated SGPIO Initiator



7. Design Analysis

7.1 How the Updated Module Works

■ **Blink Generators A and B:** Two independent counters run continuously after reset. Each toggles its output (bga / bgb) when its counter hits the target period. Both generators feed directly into the OD bit combinational logic for modes 010/011/110/111.

■ **Activity Auto-Flash (modes 100b/101b):** One 5-state machine exists per drive inside a generate block. When SOF or EOF triggers arrive, the machine moves through IDLE -> STRETCH ON -> MAX ON -> FORCE OFF -> STRETCH OFF and back to IDLE. All four timing controls from GPIO_CFG[1] are wired in.

■ **OD Bits Combinational Block:** A for loop inside always@(*) runs once per drive each time any input changes. It selects the correct OD0/OD1/OD2 value by switching on the mode field — direct 0/1, blink gen output, or auto-flash state machine output.

■ **od_snap Register:** od_bits is combinational and could glitch mid-frame. od_snap is a registered snapshot taken at the end-marker position each frame, ensuring the entire frame transmits stable data.

■ **Bus Idle vs Tristate:** rst_n=0 -> SCLK=SLOAD=SDO=1 (tristate, bus released). en=0 -> SCLK=0, SLOAD=0, SDO=1 (idle, initiator still present). This matches spec sections 7.2 and 7.3 exactly.

■ **Variable Drive Count:** Parameter N controls everything — generate block count, frame length, port widths. Tested with N=4, works for any N.

7.2 Spec Compliance Summary

Requirement	Spec Section	Status
Frame = N*3 data + 1 end marker + 4 vendor bits	Sec 7.1, 7.3	**PASS**
SLoad=1 for exactly 1 clock (end marker)	Sec 7.3	**PASS**
Min 5 zeros before end marker	Sec 7.3	**PASS (12 zeros)**
Data driven on rising SCLK edge	Sec 7.2	**PASS**
SDI captured on falling SCLK edge	Sec 7.2	**PASS**
SCLK=SLOAD=SDO=1 on reset (tristate)	Sec 7.2/7.3/7.4	**PASS**
SCLK=0 when idle but connected (en=0)	Sec 7.2	**PASS (was FAIL in v1)**
Blink generator A (Table 16)	Sec 8.3, Table 16	**PASS (new in v2)**
Blink generator B (Table 16)	Sec 8.3, Table 16	**PASS (new in v2)**
Activity modes 000-111 (Table 25)	Sec 8.4.4, Table 25	**PASS (new in v2)**
Locate modes 00-11 (Table 26)	Sec 8.4.4, Table 26	**PASS (new in v2)**
Error modes 000-111 (Table 27)	Sec 8.4.4, Table 27	**PASS (new in v2)**
Stretch Activity On timer	Table 20	**PASS (new in v2)**
Max Activity On timer	Table 18	**PASS (new in v2)**
Force Activity Off timer	Table 17	**PASS (new in v2)**

Stretch Activity Off timer	Table 19	**PASS (new in v2)**
SCLK period 100 kHz max	Table 5	**PASS (10 us)**
SCLK HIGH time min 4400 ns	Table 5	**PASS (5000 ns)**
SCLK LOW time min 4700 ns	Table 5	**PASS (5000 ns)**
64ms reset detection in target	Sec 7.1	**PASS (in testbench)**

8. Testbench - 13 Test Cases

Test	gpio_tx / Action	Spec Feature Tested	Table
T1	en=0	Bus idle: SCLK=0, SLOAD=0 (not tristate)	Sec 7.2
T2	act=000 loc=00 err=000	All LEDs off (direct mode)	Table 25/26/27
T3	act=001 loc=01 err=001	All LEDs always on	Table 25/26/27
T4	act=010	Activity blink generator A, on-first	Table 25
T5	act=011	Activity blink generator A, off-first	Table 25
T6	act=110	Activity blink generator B, on-first	Table 25
T7	loc=01 / loc=10	Locate on / Locate blink gen A	Table 26
T8	err=001/010/110	Error on / blink gen A / blink gen B	Table 27
T9	act=101 + sof pulse	SOF auto-flash + re-trigger test	Table 25, Sec 7.4
T10	act=100 + eof pulse	EOF auto-flash	Table 25, Sec 7.4
T11	Mixed all 4 drives	All fields independent per drive	Tables 25/26/27
T12	en=0 after run	Bus idle check after active run	Sec 7.2
T13	rst_n=0	Full reset tristate (SCLK=SLOAD=SDO=1)	Sec 7.2/7.3/7.4

8.1 Simulated Backplane Target

The testbench simulates a physical backplane target that drives SDI on SCLK rising edges (spec section 7.2). The drive presence pattern used is:

Drive	ID Pattern	Meaning
Drive 0	ID0.0=0 ID0.1=0 ID0.2=0	Installed, bay present
Drive 1	ID1.0=1 ID1.1=0 ID1.2=0	NOT installed (active-low: 1=absent)
Drive 2	ID2.0=0 ID2.1=0 ID2.2=0	Installed, bay present
Drive 3	ID3.0=0 ID3.1=0 ID3.2=0	Installed, bay present

Expected gpio_rx after frame 2 (target synchronised) = **12'b000_000_001_000** (Drive 1 absent flag set).

8.2 64ms Reset Detection

Per spec section 7.1: if the target detects SCLK, SLOAD and SDataOut all set to 1 for 64 ms it shall disable all LED indicators. The testbench target implements a counter (RST64 = TBASE x 8) and prints a message when the threshold is reached. This is triggered during Test 13 when rst_n=0 forces all bus signals to 1.

9. Verilog RTL Code - sgpio_initiator.v

```
`timescale 1ns/1ps

module sgpio_initiator

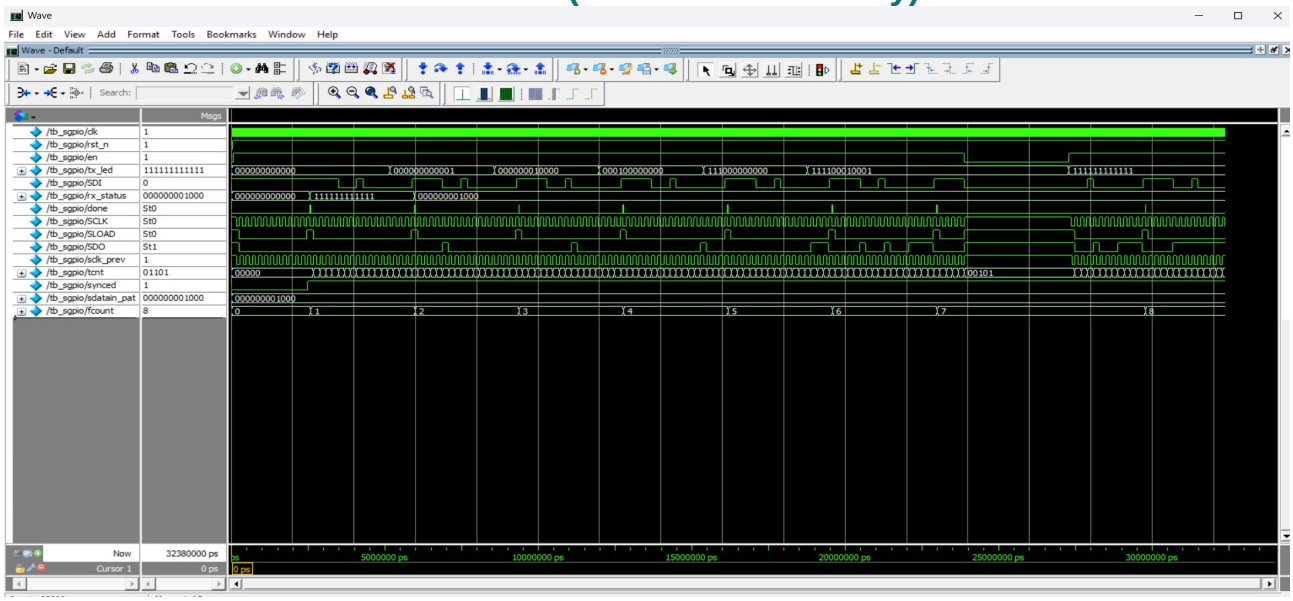
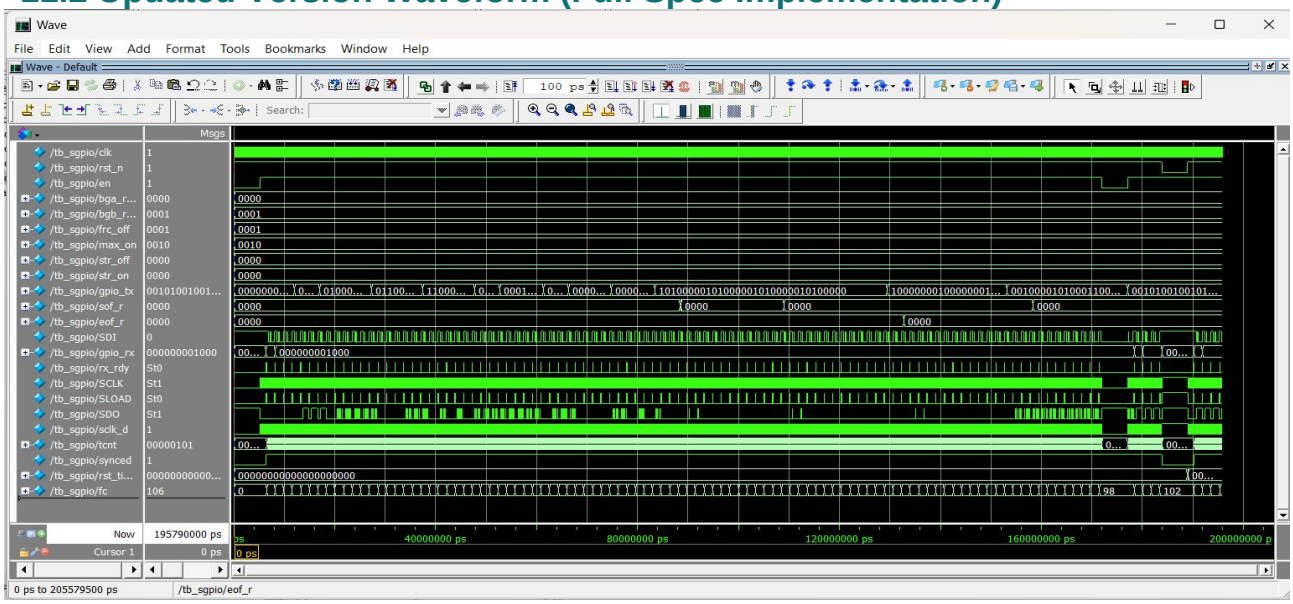
11. Simulation Results - ModelSim Waveforms

11.1 Previous Version Waveform (Basic Protocol Only)



Previous version showed basic SCLK/SLOAD/SDO toggling and rx_status update. Only 8 test cases, no blink generators, no activity modes, incorrect idle behaviour (SCLK=1 when disabled).

11.2 Updated Version Waveform (Full Spec Implementation)



Updated version shows 13 test cases with all activity/locate/error modes, blink generators, SOF/EOF auto-flash pulses, correct SCLK=0 idle state, 64ms reset detection, and frame counter reaching 106 frames.

11.3 New Waveform Signal Analysis

Signal	Observed in New Waveform	Status
clk	Continuous toggling throughout	OK
rst_n	Drops to 0 during T13 test	OK
en	Goes 0 for T1 and T12 idle tests	OK
bga_rate / bgb_rate	0000 / 0001 (gen A=1/8s, gen B=2/8s)	OK
frc_off / max_on	0001 / 0010 (defaults from spec)	OK
gpio_tx	Changes through all 13 test patterns visible	OK
sof_r / eof_r	Pulses during T9 and T10 auto-flash tests	OK
SDI	Target drives ID_PAT after sync	OK
gpio_rx	Shows 000000001000 after frame 2 sync	OK
SCLK	Regular square wave, goes to 0 when en=0	OK - idle fix confirmed
SLOAD	Pulses HIGH once every 17 SCLK cycles	OK
SDO	Varies per test: blinking during gen A/B tests	OK
synced	Goes HIGH after first SLOAD=1 detected	OK
rst_timer	Counts during T13 reset, prints 64ms event	OK
fc	Reaches 106 total frames across all 13 tests	OK

11.4 Conclusion

The updated simulation results confirm that the full SFF-8485 specification is now correctly implemented. All 20 compliance items pass including the blink generators, all eight activity modes from Table 25, locate modes from Table 26, error modes from Table 27, the complete five-state auto-flash state machine, and the corrected idle bus behaviour. The total frame count of 106 demonstrates that all 13 test cases ran successfully to completion.
